

# Learn Adobe Flash CS3 – A Beginner's Guide

## Multi-Layer Motion Tween

The Motion Tween is arguably the most popular feature of Flash. Movement can accentuate a project or be completely distracting. It is possible to have more than one Motion Tween in a movie. It is best to create a Motion Tween on its own layer.

1. Insert a Layer for a total of two layers.
2. Select the Oval tool and draw a rectangle on Layer 2.
3. Convert to Symbol (F8), graphic, and name it oval.
4. Insert Keyframe in the cell at Frame 30 on Layer 2.
5. Click between Frames 1 and 30 and select Motion from the Tween drop-down.
6. Select Frame 1 on Layer 2 and move the oval symbol just past the right edge of the rectangle.
7. Select Frame 30 on Layer 2 and move the oval symbol just past the left edge of the rectangle.
8. Select the Oval tool and draw a flat rectangle on Layer 1.
9. Convert to Symbol (F8), graphic, and name it flat oval.
10. Insert Keyframe in the cell at Frame 30 on Layer 2.
11. Click between Frames 1 and 30 and select Motion from the Tween drop-down.
12. Select Frame 1 on Layer 1 and move the oval symbol just past the left edge of the rectangle.
13. Select Frame 30 on Layer 1 and move the oval symbol just past the right edge of the rectangle.
